

ACIES GLOBAL

preventual.ai

## Do you encounter one or more of these challenges:

- A key stakeholder identifies an issue in the report weeks after analysis is completed with incorrect data.
- You struggle to reconcile your sales orders from ERP system with deals won from CRM systems.
- Your team waits for hours for a pipeline to finish running before noticing issues in the outputs.
- Your aggregate sales numbers seem to be in the right ball park and the report gets published - However, a regional leader points out several inconsistencies in her region's report for some product categories.
- An unannounced taxonomy change upstream causes incorrect analysis downstream.
- You fail to spot a significant data drift over a larger time period because of acceptable deviations at a higher cadence.

If you answered **YES** to any of these, **Preventual.ai** is built for you.

## The Solution:

**Preventual.ai** delivers decision assurance through data observability

**Preventual.ai** enables organizations to make assured decisions by **continuously** monitoring its data & data pipelines to detect issues **early**, identify root sources **quickly** and arrest further downstream propagation of the data issues.

## How Does Preventual.ai Help?

- Easily observes datasets, automatically detects relationships between them, and identifies the root source of data issues & their propagation using lineage graphs.
- Actively monitors across homogeneous & heterogeneous data sources and notifies data issues via customized alerting.
- Proactively identifies data issues in motion to avoid waiting for full runs and costly re-runs.
- Seamlessly monitors key business metrics across data hierarchies and categories to spot anomalies at any detail.
- Efficiently handles taxonomic changes automatically without impacting history.
